MVP · MOST VALUABLE PARENT

Nobody should have to be the only one who remembers.

MVP finds the camps, watches the registration windows, and turns the school's PDF into both homes' calendars. It works even when only one parent uses it.

Pre-seed · 2026 · Heather Hannan-Kramer · Miguel Alvarado

THE THESIS

Agentic software escaped the enterprise.

Two years ago, AI that could actually do things arrived for engineers. It holds the whole context, makes a plan, takes the next step, and can be trusted with the result. Claude Code turned one engineer into a team. That capability is general now. It has not reached the household.

What engineers got

An agent that holds the context, works while they sleep, and hands back finished work.

What parents got

A chatbot that has never heard of their kids.

What we built

The first one, pointed at the second job.

THE PROBLEM

The last unmanaged operations job in America.

Sales got Salesforce. Engineering got Claude Code. The family got a group text.

85%

of parents lose sleep over summer care and scheduling. 90% among working parents.

Bright Horizons Modern Family Index · Harris Poll · Apr 2026

80+

school and activity emails a month.

Yahoo / Censuswide · Jun 2024

62%

have already missed something buried in one.

Yahoo / Censuswide · Jun 2024

WHY NOW

Milo was right in 2024. They are wrong in 2026.

> *“the technology is simply too early to be reliable in any useful way”*
>
> Milo, shutting down, 12 January 2026

Agents crossed the reliability line

Tool calling plus real eval infrastructure is the difference between a demo and a deadline. That gap closed in the last eighteen months.

Voice went conversational

Sub-150ms round trip. A parent in the carpool line can talk to it now.

The category cleared

Milo closed January 2026. Yohana left the US in September 2025. Meanwhile TalkingParents killed its free plan and AppClose went paid, so demand is inelastic enough to raise prices into.

THE JOB

It's 11pm and she just remembered the deadline.

That is the moment we build for. She does not need advice, a course, or a chatbot. She needs someone to have already handled it.

She photographs the flyer

The agent pulls out every date, fee and deadline in it.

It checks the whole family

Ages, conflicts, the other kid's Tuesdays, what she said about last summer.

It watches what she can't

The registration window that opens in nine days at 9am.

One agent, one memory, five doors in: camps · classes & sports · school life · outings · trips

THE WEDGE

The window opens at 9am on a Tuesday in February.

Miss it and the camp is full, the summer has a hole in it, and the other parent finds out before you do. No national product watches these dates for parents.

We watch the window

Seven days out, and again before it opens. Never after.

We confirm, we don't guess

A date the agent researched stays labelled an estimate until the parent taps to confirm it.

An alarm watches the watcher

A miss detector pages us when a window closes unnotified. We do not expand past the pilot metros until it runs clean through a real season.

THE EVIDENCE

It shows you the sentence it got the date from.

It puts the source sentence right beside the deadline, so a parent can see it invented nothing. That detail only exists when someone builds for five months instead of demoing for five weeks.

Live on TestFlight

Onboarding, companions, and coaching grounded in a real family profile.

Backend in production

24 schema migrations, 4 live alert rules, per-call cost telemetry.

Five-layer moderation

Crisis detection on a taxonomy aligned to 988 / SAMHSA vocabulary.

Tested like infrastructure

567 automated tests. 120 kid-safety evals. 29 flow specs driven against the real API.

Voice, sub-150ms

Our backend stays the brain. The vendor only moves audio.

Content taxonomy

110 categories, 45 articles, 25 community posts mapped.

THE SCALE CASE

Camps is the wedge. The household is the company.

A seasonal tool is a good business. This gets big because solving one deadline earns the right to the rest of the household, and the graph we build getting there cannot be bought.

Act one · the wedge

Activities and coverage. One acute, recurring, seasonally forced pain.

Act two · the household

The agent already reads the email, the calendar and the paperwork. Medical and school logistics are adjacent, not new.

Act three · the transaction

We source registrations that today flow through nobody who knows the family. $3-4B a year in US camp fees alone.

Why not OpenAI

They will not take on child-safety liability, they do not have your family's graph, and trust here is won by a product a parent hands their kid, not by a better model.

THE MOAT

What compounds.

The honest question at pre-seed is not what our moat is today. It is what we are accumulating.

The family graph

Ages, interests, custody rhythm, what you tried last year and what you said about it. Every conversation deepens it. A general assistant starts from zero every session, forever.

Safety as architecture

Five layers, and a crisis lock that freezes the conversation and pushes the parent's phone, verified on a physical device. Months of work, and the part a fast follower skips.

Evals that keep it honest

Every change to a prompt or a tool re-runs a live-model golden set before it ships. It is why the agent still works in month eight.

Solo-first coordination

A co-parenting app only learns how a family runs once both parents sign up. We learn it from one side, then confirm it through the invites the other parent accepts. Our graph grows at one account per family. Theirs needs two, and the second is the one that says no.

SAFETY

If a child is in crisis, a parent's phone rings.

Safety here is architecture, not a content filter bolted onto a chatbot. Five layers sit between a child and a wrong answer, and when it matters the system stops talking and gets a human involved.

Five layers

Deterministic patterns, a moderation API, an age classifier, a streaming token-level monitor, and a final output check. The model sits on top of the backstop, never underneath it.

A real taxonomy

Severity aligned to 988 / SAMHSA ideation vocabulary and reviewed against pediatric safety practice.

The parent is paged

A crisis freezes the conversation, shows the child real resources, and pushes the parent's phone. Verified on device, July 2026.

Privacy as a position

Logistics data is durable and exportable. The coaching conversation is designed to leave nothing behind.

THE MARKET

Parents already pay. Twice, and for less.

We are not sizing a circle. We are pointing at cash registers already ringing next door.

$34M

Good Inside's 2025 revenue. 100,000+ subscribers at roughly $276 a year, for parenting advice with no coordination and no deadlines.

Fortune · Feb 2026

$110-300

OurFamilyWizard's annual price, charged per parent. Two-household families already pay twice, for software built to be read by a judge.

OurFamilyWizard pricing page

$3-4B

US summer camp registrations a year, intermediated today by nobody who knows the family.

Category estimate

100,000 families at $129 a year is $12.9M of ARR. Good Inside reached that subscriber count selling advice alone. We price at about 3% of what the activities themselves cost, one payer, hard paywall after a trial.

Every other app needs your ex to sign up.

TalkingParents publishes a help article called “What if my co-parent won't sign up?” The industry's answer is a contempt motion. Ours is a calendar invite.

They document the fight. We prevent it. ChatGPT is better than us at nearly everything and has never heard of your custody schedule.

WHERE WE ARE

Five months. In stealth. On purpose.

We have not launched. We spent the time on what kills consumer AI companies: reliability, safety, and the evals that keep both true after the demo.

What is built

Five verticals live in production. A 20-tool agent. 98 TestFlight builds. 21 parent-facing releases in the last 24 days.

What is not

No public launch. No revenue. No paywall in the app yet. We are not dressing a beta up as traction.

How we will know

The gates are written down in advance, with the numbers that would make us stop: median willingness to pay at or above $100, cost per email at or under $5, and 90-day retention above 30% before we scale spend.

THE TEAM

Both of our beachhead customers are sitting at the table.

Founder-market fit here is structural. Two founders, two different household structures, overlapping kid ages. The product's two personas are the two people building it.

Heather Hannan-Kramer · CEO

Parent, educator, consultant. Originated the concept before the pandemic. Owns product vision, audience research and go-to-market. The coordinating mother the product is designed for, with two girls at home.

Miguel Alvarado · CTO

Single father of two. Thirty years shipping software, thirteen in AI, twice a CTO. Built the whole stack: the native Swift app, the agent backend, the moderation system, the deploy.

Greg Harris · Design

Grandparent, and a design leader on consumer products. Owns visual identity and the user journey from prototype to market.

THE TECHNICAL CO-FOUNDER

Thirty years of range, in the year range became the qualification.

Breadth used to be a liability. AI inverted that: when one engineer holds the backend, the app, the model layer and the deploy in one head, the person who has worked at every layer is the one who ships.

30 years shipping

Microsoft in the Web 1.0 era. Brightcove through IPO, 450M players and ~1.3B daily video views. Intel Media's OnCue through the Verizon acquisition. VP Engineering at Vevo.

13 years in AI

CTO at Lumiata, deep learning across 100+ medical conditions. CTO at Mindstrong, digital biomarkers, reliability from 92% to 99.99%, acquired by SonderMind. VP Engineering at SonderMind today.

AI-first, and board-facing

Multi-agent systems, real-time voice and regulated guardrails, built hands-on through Artesano. Board-facing at Lumiata and MetaStories. Ten years advising Loupe, with a three-part patent.

The proof is not the résumé. It is this product: one engineer, five months. A native Swift app, a Python agent backend, a React dashboard. ~77,000 lines. 567 tests. 120 kid-safety evals. 98 builds.

THE TECHNICAL CO-FOUNDER

Thirty years shipping. Thirteen in AI. Twice a CTO.

Miguel Alvarado. I built every layer of MVP myself, in five months.

Shipped at scale

Microsoft. Brightcove through IPO. Intel Media into Verizon. VP Engineering at Vevo.

AI in production

CTO at Lumiata and at Mindstrong, acquired by SonderMind. VP Engineering at SonderMind today.

Building MVP

Native Swift app, agent backend, five-layer safety system. One engineer.

THE ASK

Fund the proof, not the promise.

The product risk is behind us. What we are buying is the answer to one question: will parents pay for this, at this price, without us in the room.

Prove they will pay

Run the gates in the pilot metros. The numbers that matter are median willingness to pay at or above $100 and 90-day retention above 30%.

Survive one season

The miss detector runs clean through a real winter-into-spring registration cycle. That is the difference between a product and a promise.

Close the two known gaps

COPPA compliance, which unlocks the kid companion we are sitting on, and the move off a single-writer database before scale demands it.

Every hard coordination job in the economy got software. The family is the last one holding out, and the technology that finally solves it arrived eighteen months ago. We built the thing. We would like to go find out what it is worth.
